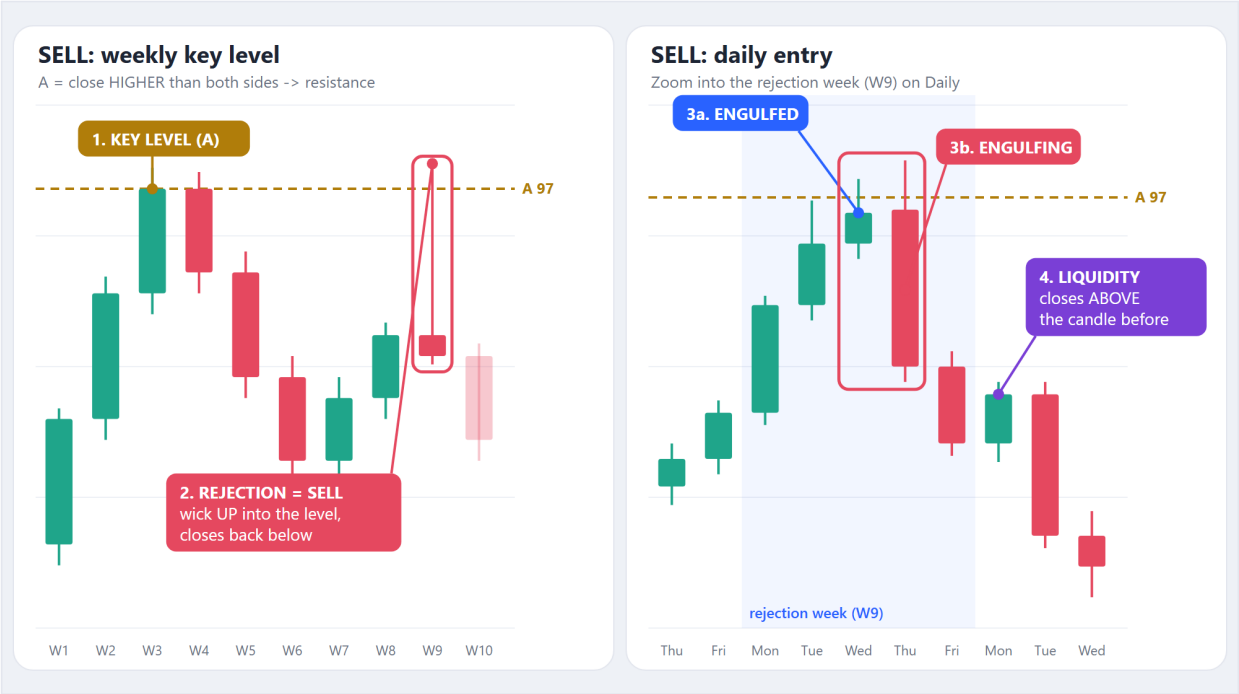
INSIDE THIS GUIDE

* How the signals work + the ATA Scanner (in pictures)
1 Find the updated indicators on TradingView
2 Install the two Chrome extensions
3 Create your Telegram bot (token + chat ID)
4 Connect the extensions to Telegram
5 Set up TradingView and test everything
6 Help & troubleshooting

THE STRATEGY IN PICTURES

How the signals work

Both indicators follow the same 4 steps of the Apex Traders Academy method: a **key level** on the higher timeframe, a **rejection** candle that gives the direction (bias), then on the lower timeframe an **engulfed + engulfing** pair and the **liquidity** candle. The dotted line is the key level.



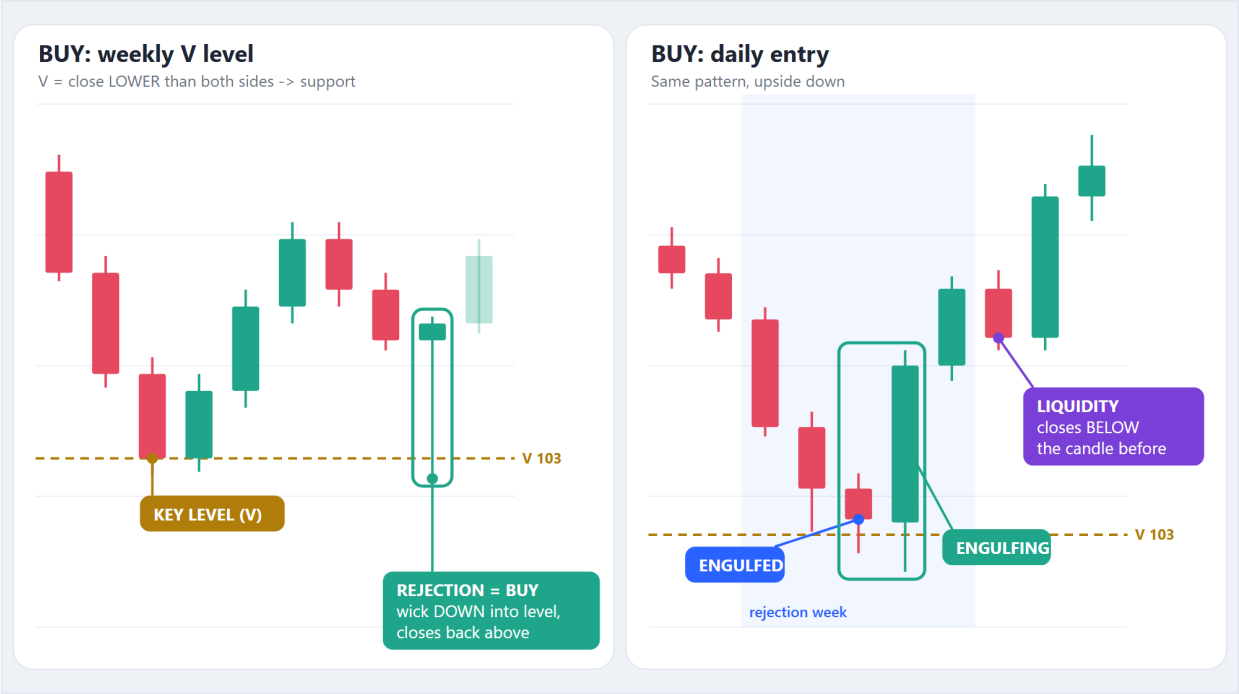
SELL: 1. A level, 2. weekly rejection from below, then on Daily 3. engulfed + engulfing and 4. liquidity

The rules in one table

Rule	What it means
Key level	Built from candle **closes**. A = a close higher than both neighbours (resistance). V = a close lower than both neighbours (support). A level that price closes through flips role.
Rejection	The candle opens and closes on one side of the level, its wick reaches into the level, and that wick is long (at least 30% of the candle). From below = SELL, from above = BUY.
Engulfed	A small candle trading into the level (usually the opposite colour to the bias).
Engulfing	The next candle goes the bias way and its body swallows the small candle's body.
Liquidity	The first pullback after the engulfing: for SELL a candle that closes higher than the one before, for BUY one that closes lower.
Timeframes	Weekly level → Daily entry candles. Daily level → 4H entry candles.

BUY setups: the same, upside down

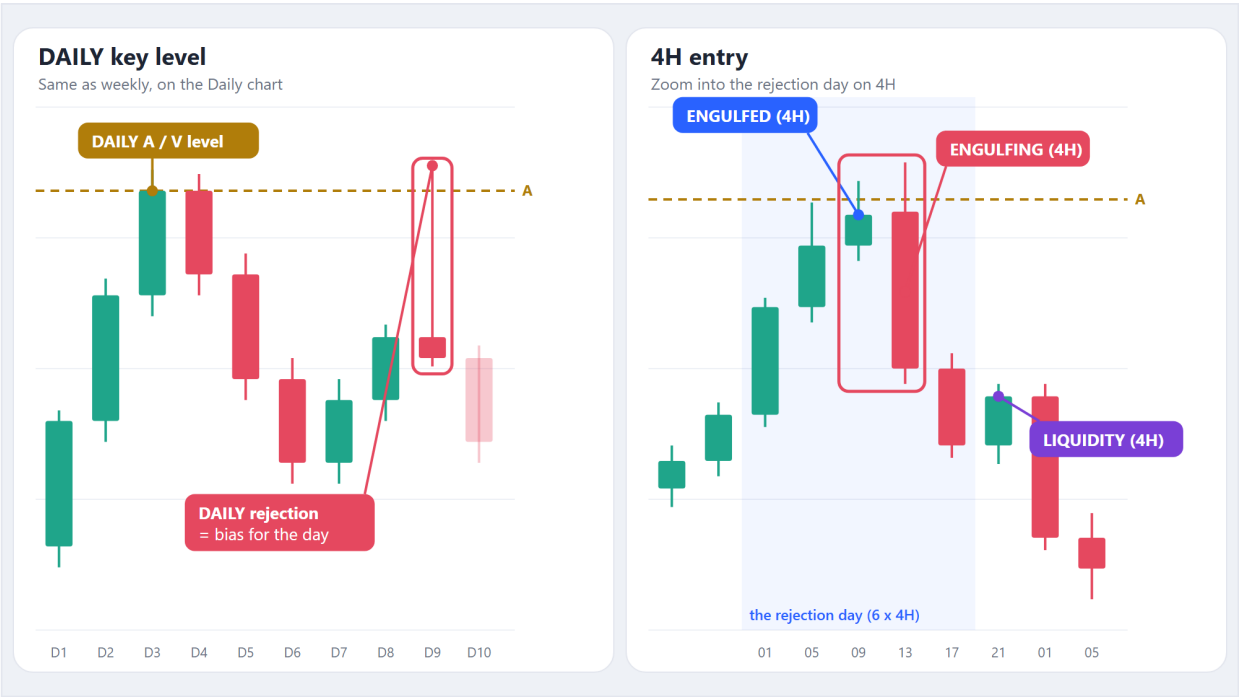
A **V shape** (a close lower than the closes on both sides) makes a **support** level. A weekly candle that wicks **down** into it and closes back above gives a **BUY** bias. The daily engulfing candle is green, and the liquidity candle closes **below** the candle before it.



BUY: V level, rejection from above, then the daily entry

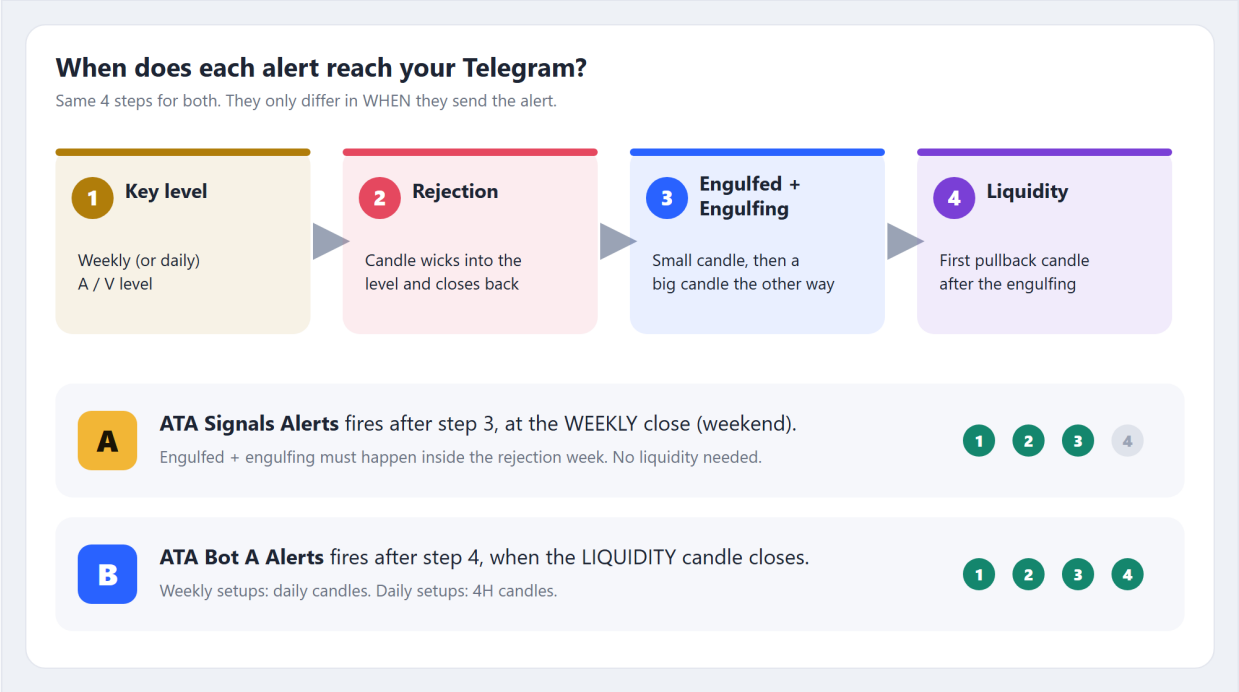
Daily key levels: one timeframe lower

Exactly the same logic one step down: a **daily** A / V level and a **daily** rejection candle give the bias, and the engulfed, engulfing and liquidity candles come on the **4H** chart.



Daily level and rejection, then the 4H entry

When does each alert arrive?

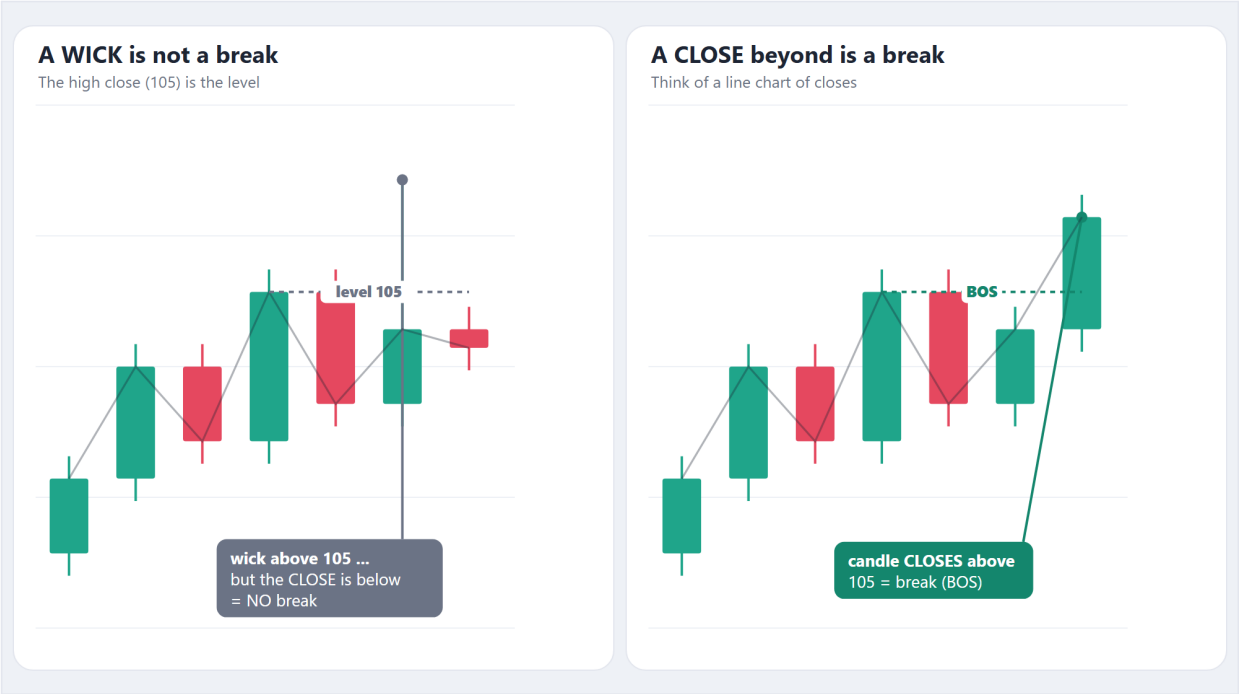


Education only. The alerts tell you a setup formed according to the rules. Always check the chart yourself and manage your risk before you trade.

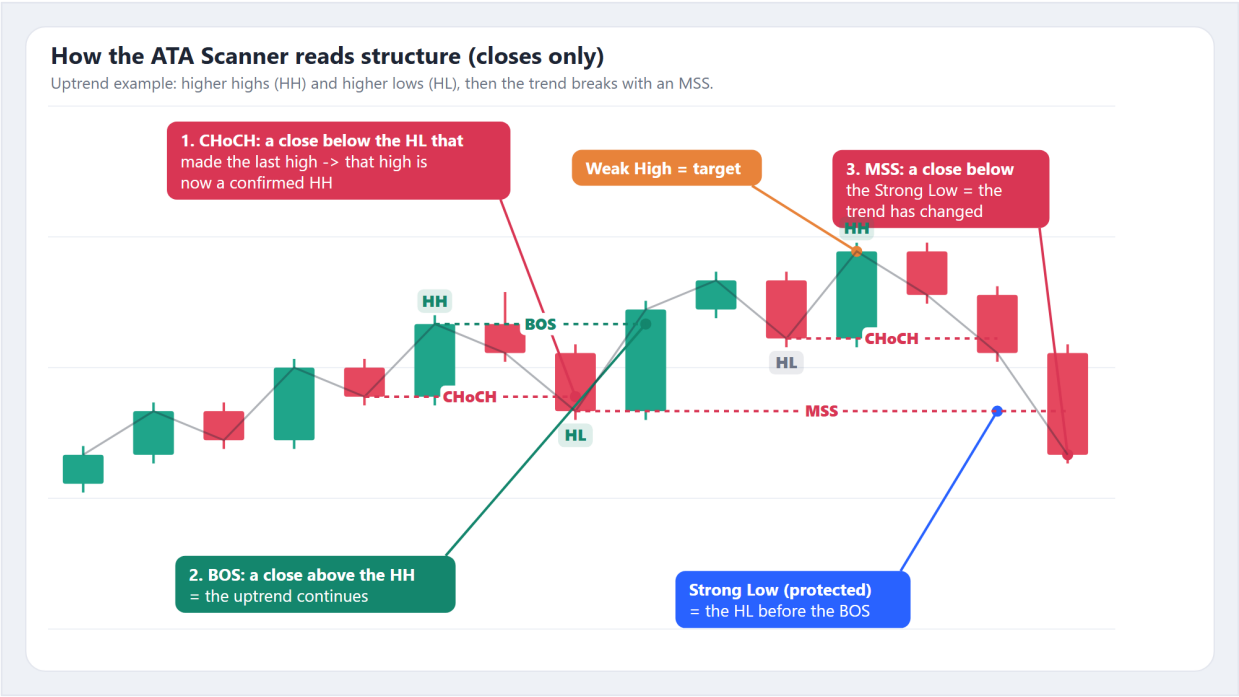
THE ATA SCANNER

Reading market structure

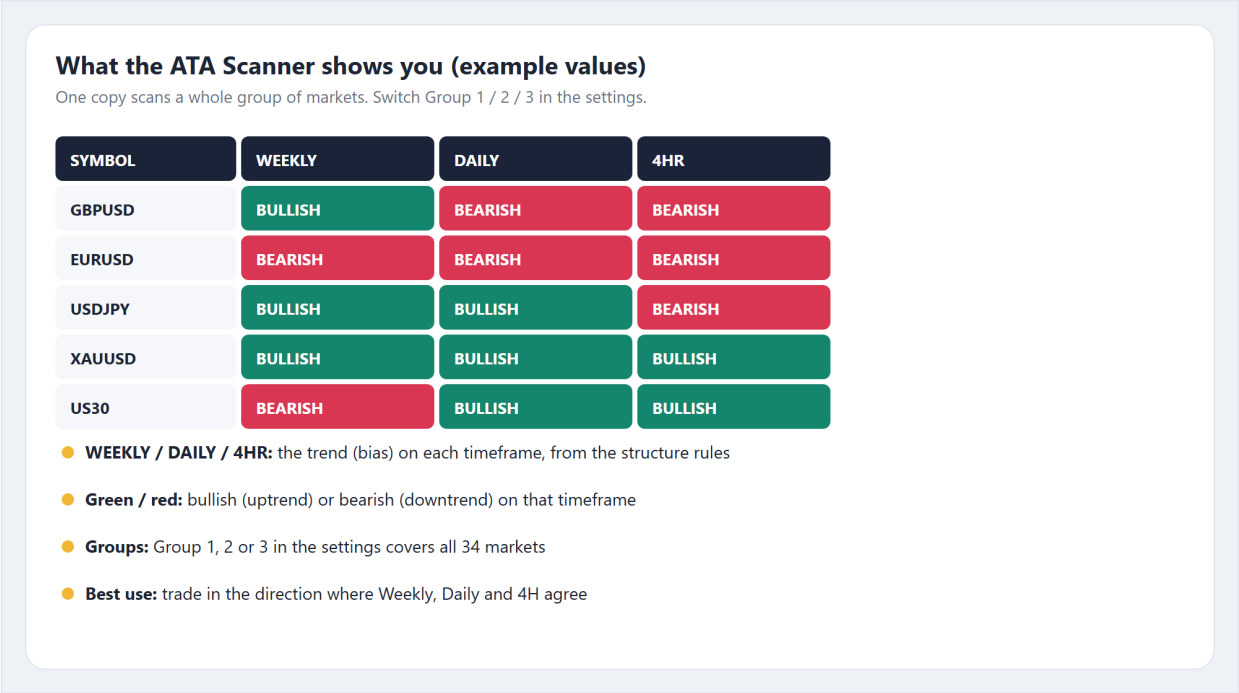
The **Apex Traders Academy - Structure Scanner (W / D / 4H)** shows the trend on your chart and the **Weekly, Daily and 4H bias** of a whole group of markets in one table. It reads structure from candle **closes only**, like a line chart: wicks never count.



Only a candle CLOSE beyond a level breaks it. A wick through the level is ignored



CHoCH confirms the high, BOS continues the trend, MSS (close below the Strong Low) changes it



The scanner table: the Weekly, Daily and 4H bias of each market

The structure words

Word	What it means on the ATA Scanner
HH / HL	Higher High / Higher Low: an **uptrend** (bullish).
LH / LL	Lower High / Lower Low: a **downtrend** (bearish).
CHoCH	Change of Character: a close below the HL that made the last high (or above the LH that made the last low). It **confirms** that high / low.
BOS	Break of Structure: a close beyond the last HH (uptrend) or LL (downtrend). The trend **continues**.
Strong Low / High	The protected level of the trend: the HL (uptrend) or LH (downtrend) that produced the last BOS.
Weak High / Low	The last high (uptrend) or low (downtrend): the next **target**.
MSS	Market Structure Shift: a close through the Strong Low / High. The trend has **changed**.

How to use it: trade in the direction where **Weekly, Daily and 4H agree**. When the WEEKLY SETUP column turns orange, a weekly key level was rejected: watch that market for the daily engulfing and liquidity candles.

PART 1

Find the updated indicators

The alerts read the signals of two Apex Traders Academy indicators. Add the **updated** versions to your TradingView chart.

1. Open your chart on **TradingView** (the free plan is fine).
2. Click **Indicators** in the top bar.
3. Type the search text from the table below and click the **full name**.
4. Already had an older copy on your chart? **Remove it first**, then add it again so you get the new version.

Indicator	Type this in the search	Full name to click	Works with the alert extension?
Bot A Scanner	Bot A Scanner 2.0	Bot A Scanner 2.0: Key Level Bias + Engulfing Entry	**Yes**
ATA Signals	Weekly Key Level Signals	Apex Traders Academy - Weekly Key Level Signals	**Yes**
ATA Scanner	Apex Traders Academy Structure	Apex Traders Academy - Structure Scanner (W / D / 4H)	**Not needed** - it does not send alerts

Not in the search yet? New scripts can take a few days to appear in TradingView's search. Use the links below, press **Add to favorites** (star), then on your chart open **Indicators** → **Favorites**.

Bot A Scanner 2.0	Open Bot A Scanner 2.0 on TradingView →
ATA Signals	Open ATA Signals on TradingView →
ATA Scanner	Open ATA Scanner on TradingView →

Tip: everyone should use **Bot A Scanner 2.0** so all students get the same signals.

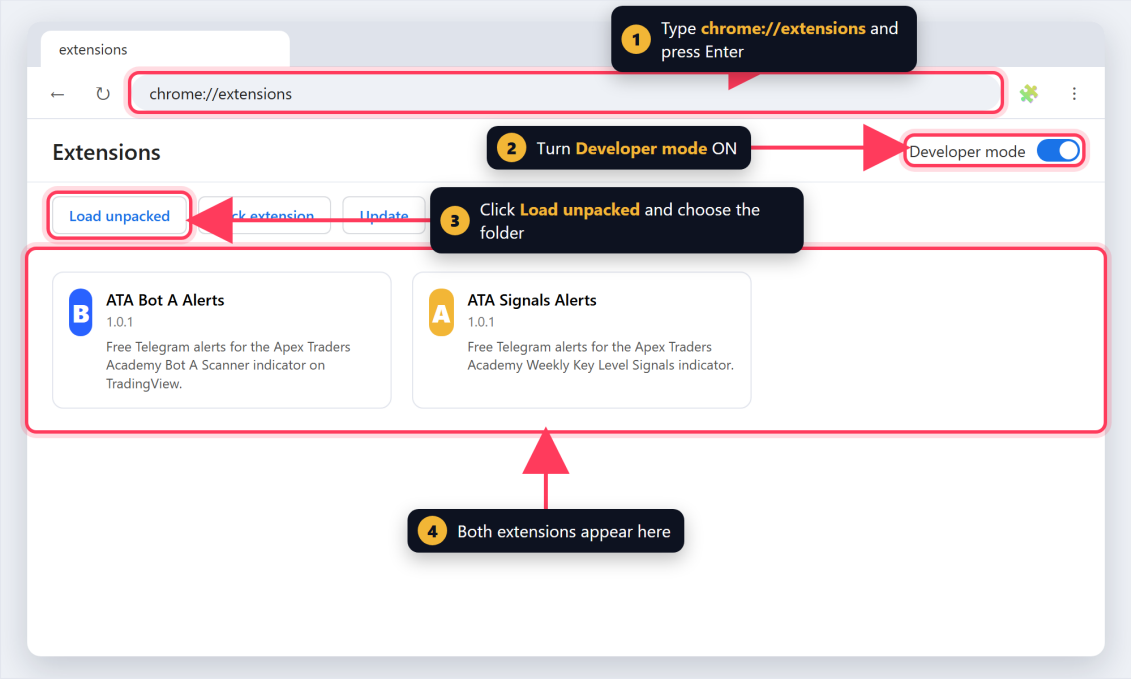
PART 2

Install the two Chrome extensions

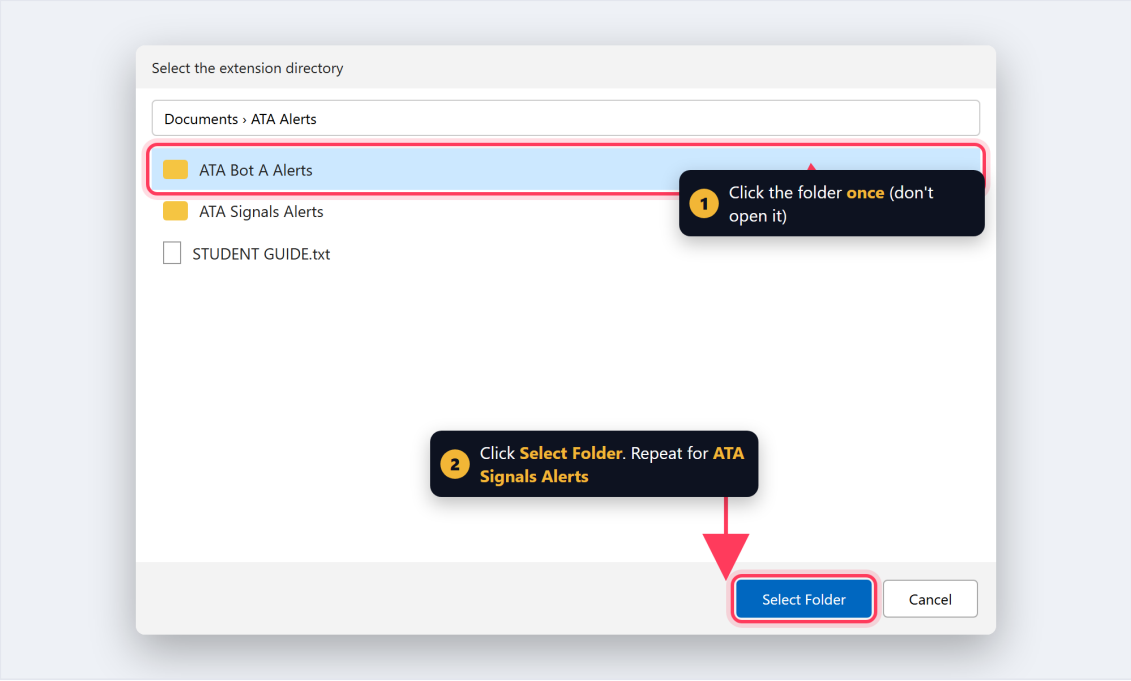
DOWNLOAD BOTH EXTENSIONS ↓

ATA_Alerts_Student_Pack (zip, 25 KB): ATA Bot A Alerts + ATA Signals Alerts + student guide. Button not working? Open it on Google Drive and press Download. The file is also attached inside this PDF (paperclip / Attachments panel in Adobe Reader).

After downloading: right-click the zip → **Extract All** → **Extract**. Keep the folder (e.g. in Documents): Chrome uses it, so don't delete or move it later.

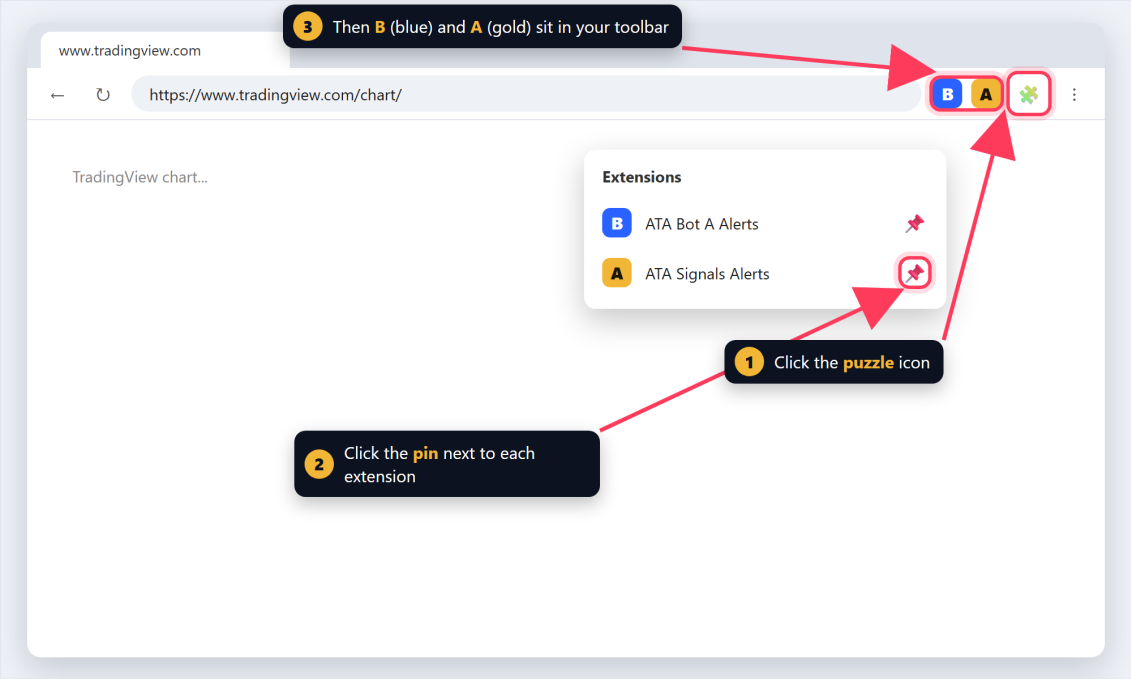


Chrome's extensions page: Developer mode ON, then Load unpacked



Choose the folder, then do it again for the second extension

Pin them to your toolbar

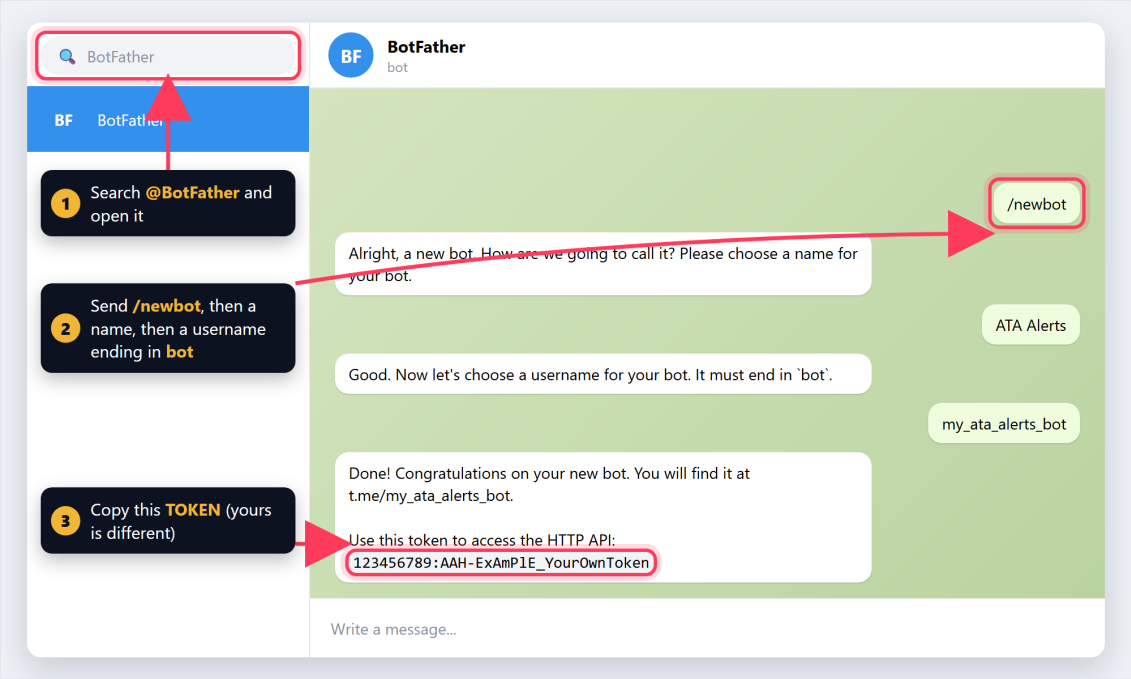


Pinned extensions are one click away: B = Bot A Alerts, A = ATA Signals Alerts

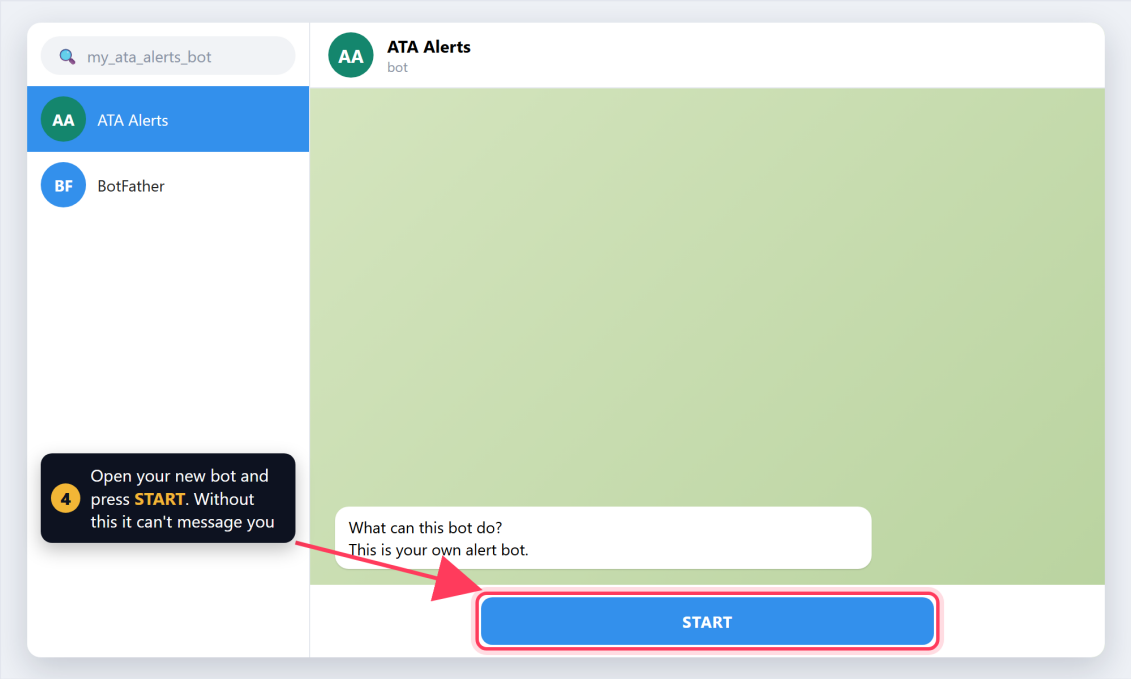
PART 3

Create your Telegram bot

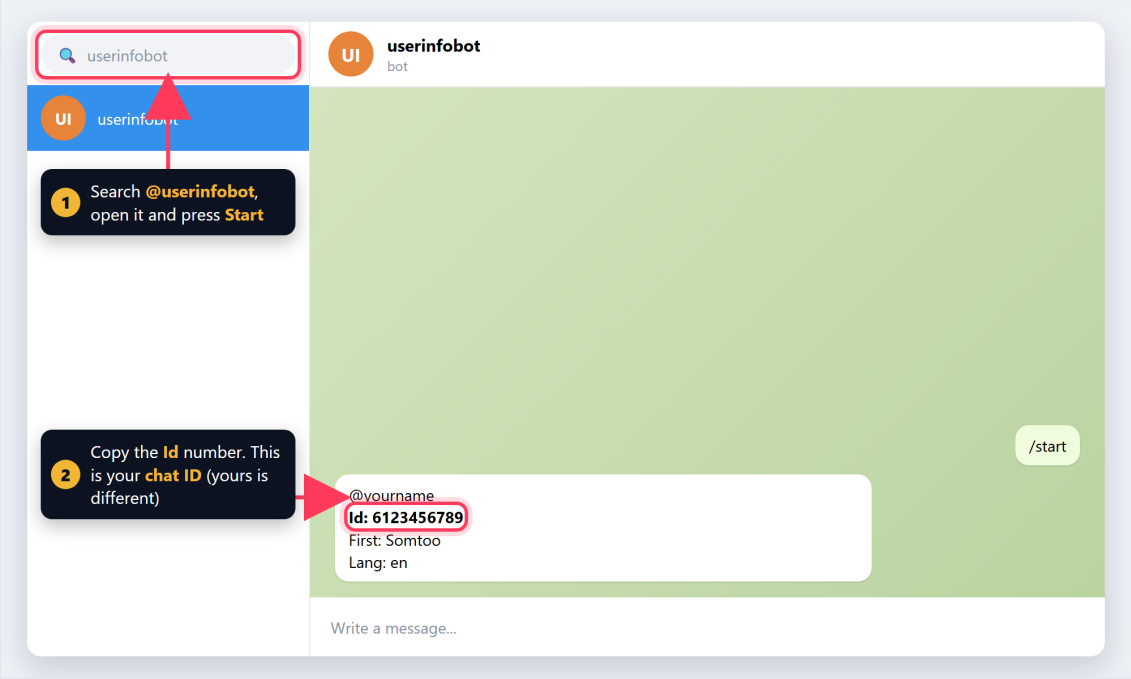
Your alerts come from **your own** free Telegram bot. You need two things: the bot's **token** and your **chat ID**.



@BotFather creates the bot and gives you the token



Open your new bot (BotFather shows the link) and press START once



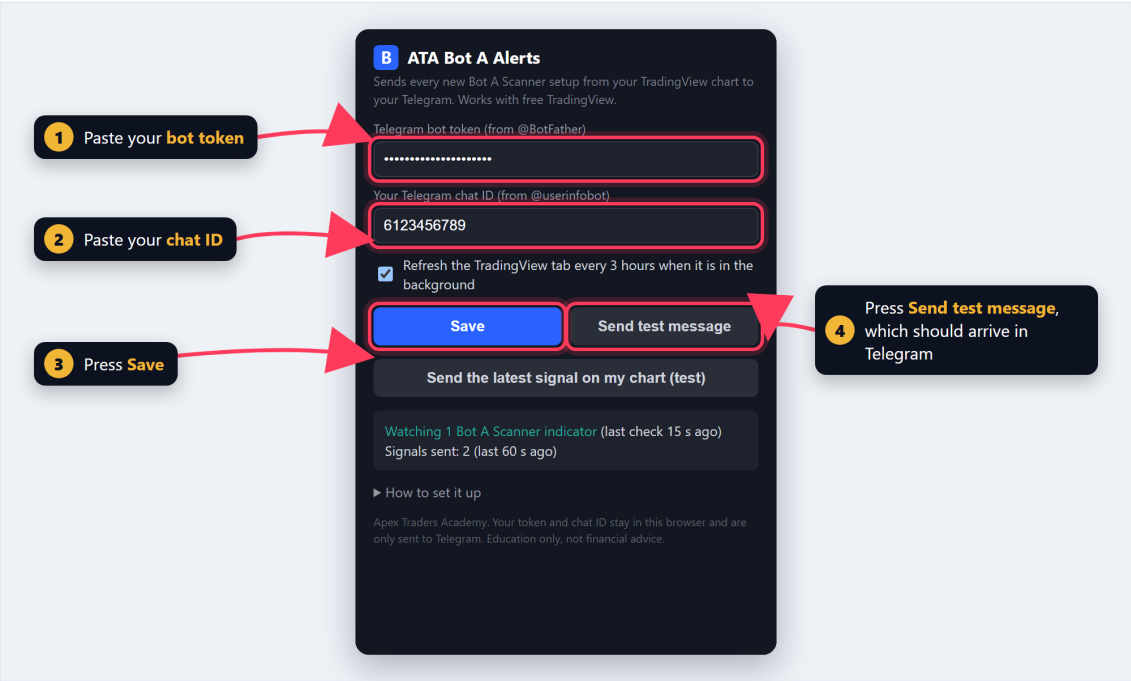
@userinfobot shows your chat ID

Keep your token private. Anyone with it can send messages as your bot. Never post it in a group.

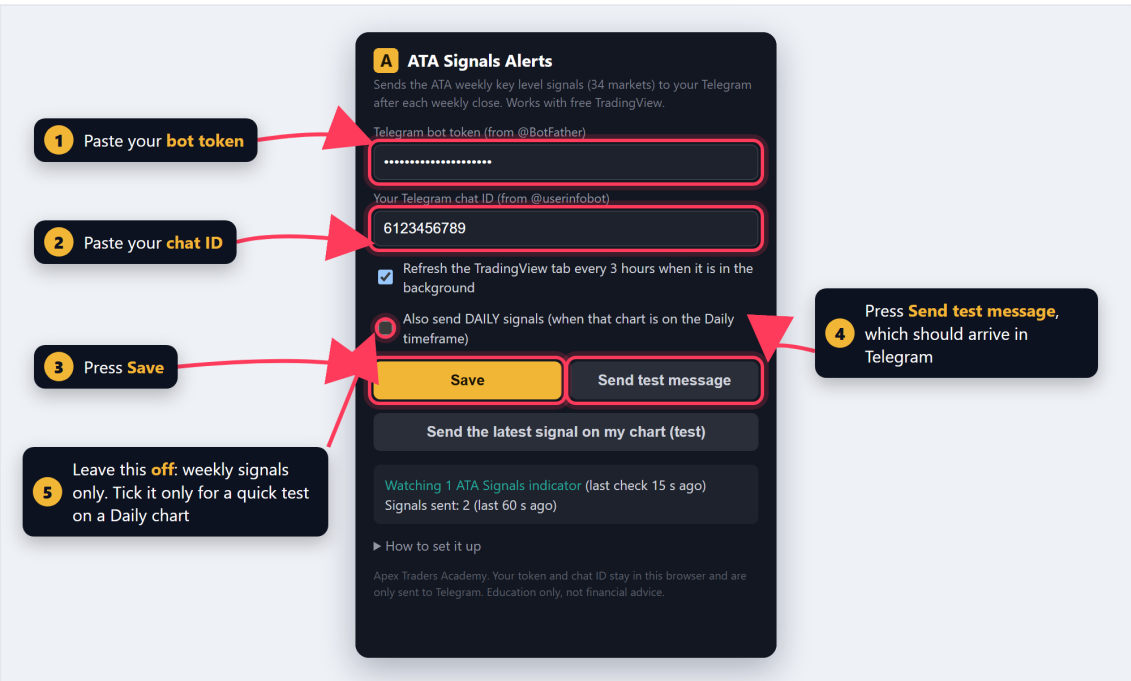
PART 4

Connect the extensions to Telegram

Click the **B** icon in Chrome's toolbar, then do the same in the **A** icon. You can use the same token and chat ID in both.



ATA Bot A Alerts (blue B)

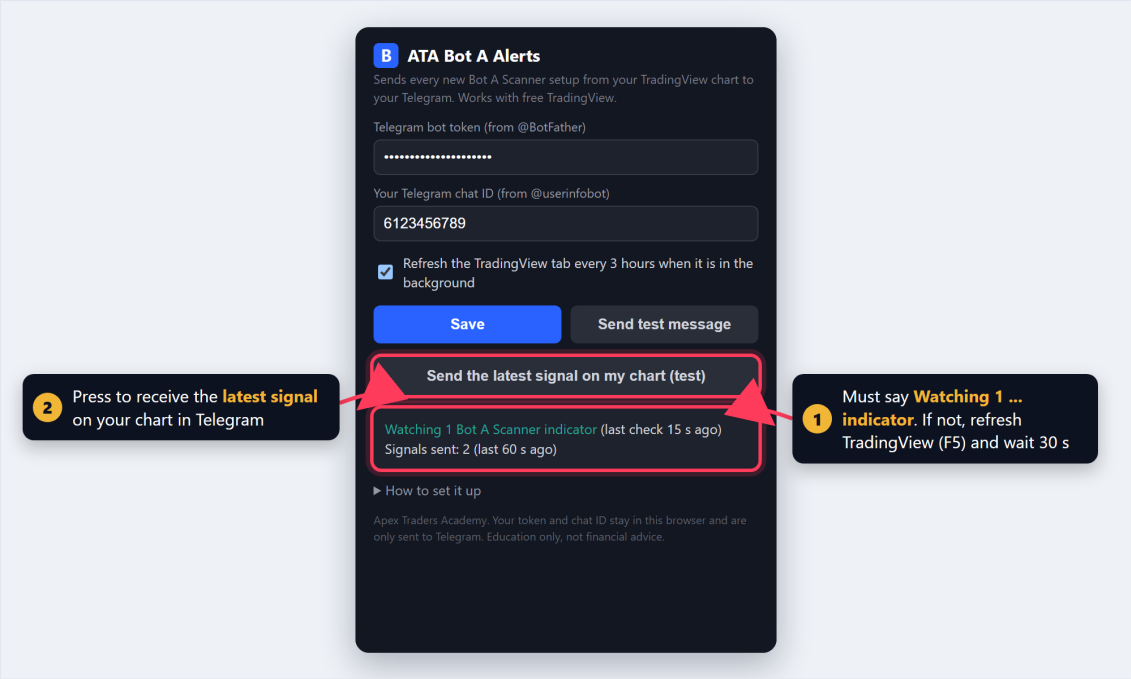


ATA Signals Alerts (gold A): same steps

PART 5

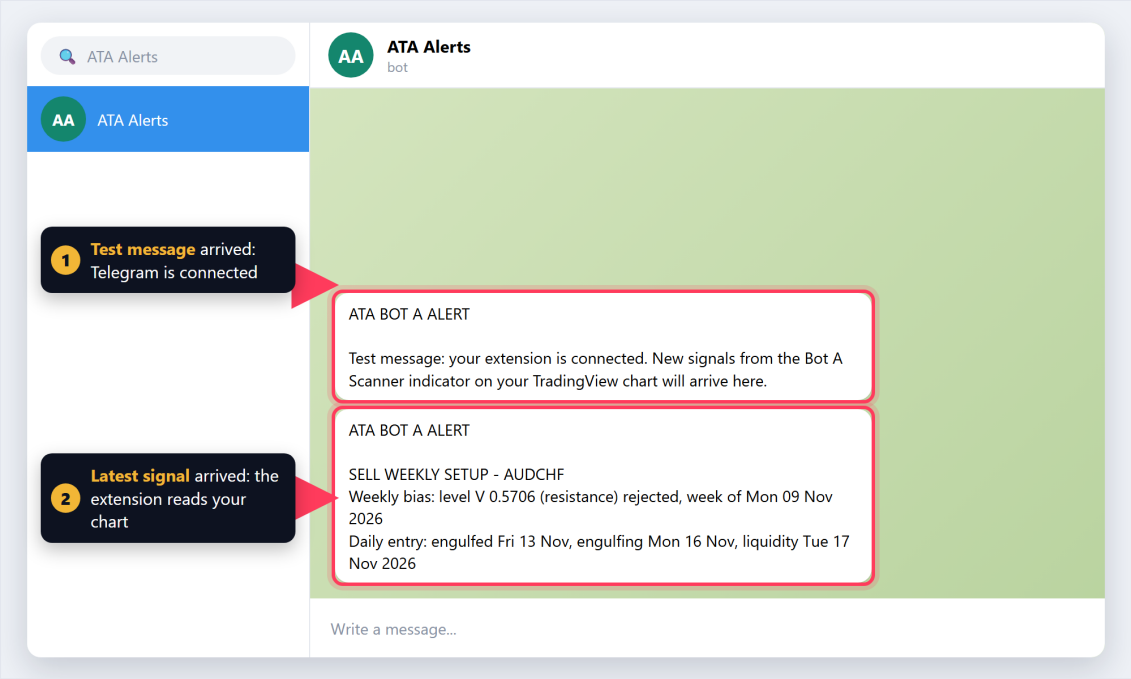
Set up TradingView and test everything

1	**Bot A:** add **Bot A Scanner 2.0** to a chart. One copy scans 12 markets: choose **Group 1, 2 or 3** in its settings. Free TradingView allows 2 indicators per chart, so use a second tab if you want all 34 markets.
2	**ATA Signals:** add **Weekly Key Level Signals** to a chart set to **Weekly (1W)** and the symbol **BTCUSD**. BTC trades at the weekend, so the signals come out Saturday/Sunday after the weekly close.
3	Refresh the TradingView tab (**F5**), wait **30 seconds**, then open the extension and check the status box.



The status box must say Watching 1 ... indicator. Then press Send the latest signal

What you should receive



Test message + latest signal = everything works

After the test you only get **new** signals. Signals that were already on the chart are not sent again. Bot A messages come right after a 4H / daily candle closes; ATA Signals come once a week after the weekly close.

PART 6

Help & troubleshooting

You see	Do this
Send test message fails	Check the token and chat ID (no spaces). Open your bot in Telegram and press **START**.
No TradingView chart is being watched	Open the TradingView chart, press **F5** and wait 30 seconds. Keep the tab open.
Indicator was not found	Remove the indicator and add it again (Part 1). Old copies don't work with the extension.
Send the latest signal fails	The chart has no signal yet. For ATA Signals put the chart on **1W**, or tick "Also send DAILY signals" just for the test.
No alerts for a while	Normal when there are no new setups. Make sure Chrome and the TradingView tab stay open.

Stop Chrome from putting TradingView to sleep: Chrome Settings → Performance → **Always keep these sites active** → Add → **tradingview.com**
